THE OPPORTUNITY

Less searching. More meaning.

Gift buyers know the person. They don’t always know where to start. A thoughtful concierge turns a moment of uncertainty into a smaller, relevant selection.

- Guide customers from intent to discovery.
- Explain the fit, so people can choose confidently.
- Test the business impact. Don’t assume it.

Three ways to say “I thought of you.”

A mobile-first journey that makes space for different gifting needs.

- Find a gift: five steps, explained matches, honest constraints.
- Build your own: personal details and transparent totals.
- Gift for a team: a practical brief for a future assisted quote.

Clear rules today. Grounded AI tomorrow.

This demo uses mock CAD prices and a deterministic engine. No real AI service is connected.

- Budget and preferences are hard filters. Interest and occasion tags rank eligible gifts.
- An LLM could interpret intent or explain verified catalog matches.
- Validate IDs, prices and constraints. Keep a rule-based fallback.

Start small. Keep checkout familiar.

Pilot through a theme app extension with a reusable React concierge and the merchant’s existing checkout.

- Storefront API: verified products, variants, price and inventory.
- Cart API: real variants handed off to Shopify’s secure checkout.
- Backend app/app proxy: optional LLM, catalog sync and corporate intake. Headless is a broader alternative.

Personal doesn’t need to be intrusive.

This prototype sends no answers to a service. It has no cookies, contact capture or analytics; state disappears on reload.

- Minimize prompts and apply appropriate consent and vendor retention terms.
- Keep addresses in secure checkout/intake. Never send recipient spreadsheets to an LLM.
- Exclusion labels need verified metadata. They are not allergy-safety guarantees.

THE MEASUREMENT

Earn the next phase with evidence.

Compare the concierge with existing browsing in a randomized pilot. Establish baselines and sample-size criteria before setting targets.

- Primary: purchase conversion. Supporting: finder completion, recommendation add-to-cart and average order value.
- Corporate: qualified briefs. Guardrails: performance, accessibility, no-match rate and returns.
- Next: verify branding/catalog, build in a development store, review privacy/accessibility, then experiment.

Informed by read-only research of Black Bow's public homepage, story, design-your-own and corporate pages. Original design and artwork; merchant approval and verified catalog integration are still required. Business improvements are hypotheses, not measured results. Full sources, KPI definitions and implementation details are in the repository documentation.
